

VoIP Line Adapter Connections

Notes:

- **IMPORTANT! Connect VoIP Line Adapter to the FIRST Router... the Router that is connected directly to the Internet.**
- You can connect the VoIP Line Adapter to a Data Switch that is connected to the FIRST Router.
- **Router:** Typically ONE Internet port and FOUR LAN ports.
- **Data Switch:** Typically all ports look the same. It will usually say "Data Switch" on it somewhere. A Data Switch may be necessary if your router has too few ports to connect the Gateway. Data Switches duplicate LAN ports.
- The color of your cords may be different. Cord colors here are for clarity of connections only.
- One Ethernet cord is supplied with each Gateway (cords shown in BLUE).
- The GREY Telephone Line Cords are supplied with the X16 Server when purchased in a bundle.
